NOTE: For paving slab applications, some contractors prefer to pre-compact screeded bedding sand with a small plate compactor. If pre-compaction is done, care must be taken to leave no indentations in the bedding sand surface from the plate compactor. These can be removed by screeding the surface to create a thin layer (6 – 10mm) of uncompacted sand (also known as fluffing). Paving slabs do not interlock and therefore do not spread loads to their neighbors via joint sand. Given this condition, there is no requirement to force bedding sand into the bottom of the joints when compacting the units on uncompacted bedding sand, as is done with interlocking concrete pavers. Compacting large slab units could lead to unnecessary breakage, so many times contractors may choose to use a mallet to tamp the slabs into place once laid. Slabs do not meet the standard compressive and flexural strengths of interlocking concrete pavers, therefore, ***Belgard® will not be responsible for breakage to slabs caused by compaction.***
